REPORT

Employee Agent V1 workshop — package, app & guide are built and tested

Here's where things stand for the hands-on workshop. Attendees install one package, click **Run Setup**, and build their own meeting-note agent in Agent Studio — guided step-by-step by a web app. Everything below is deployed to the sandbox and verified working in the browser.

 2026-06-11

flow steps verified

| What we built

1 • The installable package (Salesforce, unlocked)

One install link lands everything the attendee needs *around* the agent. No CLI, no Setup spelunking.

- ✓ **Employee Agent Workshop** Lightning app with a Home launchpad
- ✓ **Workshop Launchpad LWC** — a link to the guide + a one-click **Run Setup** that assigns the right permission sets to the attendee
- ✓ **Setup controller** (Apex) — idempotent, assigns the standard Agentforce + Prompt

Template perm sets + our workshop perm set

- ✓ **Deploy accelerator** (optional) — a button that deploys, publishes & activates a starter agent for you (backup-org / stuck-attendee path)
- ✓ Config metadata, perm set, app/tab/Home page, and the starter agent script (static resource)

Reinstall command: `sf package install --package 04tWt000000GDJ3IA0 --target-org <org> --wait 20 --no-prompt`

2 · The self-guided workshop web app

A React guide that walks a non-developer from zero to a working agent. [Live on Heroku →](#)

- ✓ **Overview** — the use case + what's preconfigured
- ✓ **Get Your Org** — your own org, with **Agentforce Labs as the free backup org**
- ✓ **Install the Package** — the real install link is wired in
- ✓ **Part A (guided MVP)** — open the agent → reasoning instructions → add Log Note + Summarize → preview → commit → test
- ✓ **Part B (free exercise)** — incl. a full worked **Query Records** example: find an Account by name and associate the note to it

| The attendee journey — in screenshots

Captured live from `hackathon_sandbox` with the package installed.

1 · The launchpad (package Home page): open the guide, Run Setup, optional accelerator. The green banner confirms setup is complete.

2 · App Launcher → Agentforce Studio

3 · Agentforce Studio — the agents list

4 · The Agent Builder — Explorer (Agent Definition · Settings · Subagents · Variables · Connections · Data) and the

embedded Agentforce assistant.

5 · The Notes Agent subagent — Reasoning Instructions (what the workshop teaches you to write)

6 · Preview / Live Test Mode — test before going live

7 · Live demo — given "Log these notes from my call with Acme: renewal quote by Friday + billing question on invoice 4012", the agent summarized into structured call notes & follow-ups.

Nice teaching moment: this particular agent had the *reasoning instructions* but no *Log Note action* wired, so it replied "I can't update records from here." That's the workshop's core lesson made visible — **instructions give the agent judgment; actions give it the ability to act.**

What's verified

CAPABILITY	STATUS	EVIDENCE
Package installs into a clean sandbox	PASS	Install request Status SUCCESS
App loads to the launchpad (no "No Items")	PASS	Screenshot 1
Run Setup assigns all permission sets	PASS	"Setup complete" banner; 3 perm sets assigned
Agent Studio → Builder → Preview works	PASS	Screenshots 4–7
Agent reasons over meeting notes live	PASS	Screenshot 7
Accelerator deploys + publishes + activates an agent	PASS	Bot created & activated via NGA Connect API
Apex test suite	13/13	Run in the sandbox
Workshop guide deployed & reachable	PASS	HTTP 200 on Heroku

I Bugs found & fixed this round

- **App showed "No Items"** — the Home tab had been rolled back by an earlier failed deploy + the perm set lacked tab visibility. Fixed.
- **Run Setup failed** — it referenced a broken scaffold permission-set group (`AFDX_User_Perm`s). Switched to assigning the standard out-of-the-box perm sets directly.
- **Namespaced perm-set lookup** — `force_...` names weren't resolving. Fixed the controller's namespace handling.
- **Removed scaffold junk** (weather demo classes, `Resort_*` perms, etc.) that was breaking the package build.
- **Accelerator name collisions** — hardened to auto-pick a free name if the agent already exists.

| Guide review — suggested improvements

An independent critique pass flagged these; the highest-value ones are already applied (Query Records example, subagent-level instruction paths).

- ✓ **Applied:** added the worked **Query Records** example (find Account by name → associate the note)
- ✓ **Applied:** corrected UI paths — reasoning instructions live on the *subagent* via the Explorer; actions added under "Actions Available For Reasoning"
- **Suggested next:** add screenshots into Part A's build steps; per-step time budgets; "pick 1–2" guidance for Part B; inline "if it doesn't work" recovery boxes; glossary for `currentRecordId` / "subagent"

| What's next

- Build/confirm the **action assets** in the asset library (Log Note flow + Summarize prompt template + the Part-B add-ons)
- Finalize the **starter agent** shipped to attendees (pre-wired vs. blank) and the simplest reasoning-instruction wording
- Fold the remaining guide polish (screenshots, timings, recovery tips) into Part A
- Confirm the official **install link** / distribution for the event
